Gender		
Female	2	0.8%
Male	2	0.8%

¹Does not include persons with pending COVID-19 tests or persons with COVID-19 related illness who have not been tested.

²Ever hospitalized, even if released.

COVID-19 symptoms are similar to those of influenza, so monitoring influenza-like illness (ILI) may also help identify COVID-19. ILI activity in 2020 that is higher than what was experienced in 2019 could indicate the presence of COVID-19 in the community.

Annual influenza surveillance conducted by CDPH includes information on outpatient visits to health care providers for ILI. ILI is defined as fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat without a known cause other than influenza. In addition, ESSENCE is a surveillance system that uses the chief complaints of patients visiting emergency departments to monitor for ILI.

Percent of weekly outpatient visits at reporting providers due to influenza-like illness in Chicago, 2019 vs. 2020

Percent of daily emergency department (ED) visits due to influenza-like illness in Chicago, 2019 vs. 2020
